Sony a77 ii used

Back in Front as the Best Prosumer DSLR Pros: 1) Upgraded sensor, fully competitive with the new Toshiba sensor in the Nikon 7100/5300 and identical to the high rated chip in the A6000 (presumably minus its phase detection circuitry). Depending on one's metric, between 1/3 and 3/4 stop (more or less) better in terms of noise relative to the 2011 24MP Sony chip in the previous generation A65/77. Combined with improved JPEG engine, a full stop less noise and/or loss of detail in JPEGs. 2) Upgraded autofocus system with 79 PD autofocus...s points, fast, and accurate. Highly configurable within menu settings. Best autofocus system in the industry? If not the best, certainly one of the best. 3) Excellent OLED EVF (2.4mp), modestly improved over from previous generation A77/65. I believe that this is one of if not the best viewfinder in the digital world with a big, bright and detailed view of your subject (but see cons). Using this EVF is a revelation, particularly compared to the sense of looking down a narrow dark tunnel in many subframe OVFs in low light, and once you've used this, you just can't go back to OVF. Offers live and immediate feedback on how your picture composition is going to change as shooting parameters are modified, and with many configuration options, including a great level, and all kinds of other useful information. (See Tim Naff's review on the Alpha 99 for some additional insights on how this EVF system helps your shooting and composition in ways that no OVF could hope to). 4) Great operating system that can be heavily customized to individual preference with deep feature set (including excellent high dynamic range and panorama modes). Fine aperture priority mode (my personal preference), but camera can be easily run in full auto for those who are slightly technophobic and conversely can be tweaked to the Nth degree for the technophile. This is obviously not the camera for the technophobic, but its basic ergonomics are well thought out and mostly seamless. Excellent AUTO+ mode for the less experienced. 5) Decent lens options (although clearly less than CanNikon), particularly a very strong 16-50 2.8 Sony lens (see my brief summary review of this lens on Amazon and formal testing on Imaging Resource). The 16-50 2.8 is perhaps the best walk around zoom lens (with a 24-75mm equivalent view) out there, and a good reason to buy a Sony Alpha camera - compares favorably with Canon L, Zeiss, and other pro-grade glass. 6) Full-time live view - leagues better than the tacked-on-afterthought version of live view on classic SLR mirrored cameras. Way more responsive, way faster, and simply way better. Again once you've used one of the Sony SLT systems, it's hard to go back to the old way of doing live view. 7) Full-time phase detection autofocus in movie mode, not available on most DSLRs (although an increasing number of manufacturers are using phase detection on chip to get around this limitation). Sony's approach is still better and the autofocus module is remarkably effective at tracking moving subjects, and its parameters can now be user customized. Getting very few out of focus video clips is an underappreciated plus of this new system. 8) In camera image stabilization means that EVERY lens you put on this camera is automatically image stabilized - IS system is worth at least two stops. This really enhances low light shooting and allows the camera to actually EXCEED full frame lowlight ability on a non-stabilized lens by ~ a full stop (more or less). Completely transparent operation and I believe the best implementation of in-body IS in the industry. 9) Camera firmware corrects in JPEG for classic lens problems of chromatic aberration, barrel/pincushion distortion, and vignetting. Most popular Sony lenses, including all the primes, the 16-50, and all the G lenses have correction profiles. Underrated plus (and becoming a more common feature, but pioneered by Sony). 10) In highly critical shooting, you don't have to worry about mirror shake, mirror lockup and all of that nonsense. This is a deceptively significant issue for the full frame cameras (big issue on the Nikon 800 but also in the APS-C camera group such as Nikon 7100 when trying to get maximum resolution out of the current generation of high-resolution sensors 24-36 megapixels). That moving mirror introduces discernible distortions and this simply is not an issue here or anywhere else in the SLT family. 11) Everything on this camera is fast, not just its maximum burst rate (a class leading 12 frames per second) but its autofocus, menu operation, picture preview, etc. Everything is pretty snappy and you don't spend any time waiting for results - not that the previous generation was slow. 12) Dramatically improved buffer depth means that that continuous shooting speed is now a meaningful statistic (as opposed to just advertizing), and you can capture a full 5 seconds at 12 frames per second (~60 shots in JPEG and ~24 shots in RAW). Previous generation was hampered by very poor buffer depth which meant that its high shooting speed was really more academic than meaningful (a real plus over the Nikon 7100 which is hampered by the same issue.) Now a real sports camera with its improved autofocus tracking. 13) As an adjunct to the great autofocus system (which can be heavily customized and reconfigured), you can adjust the AF for lenses that are back- or front-focusing a bit. Almost every lens can benefit, and this fixed a chronic problem for me with two of my lenses (AF not micro-adjustable on A65). Cons: 1) Less rich system ecology for the professional photographer compared to Canon-Nikon. In particular, lens options are considerably less impressive than CanNikon, particularly as you get into telephoto zooms. But this support is overall improving (excellent battery pack, external mic, and other accessories for pro-level shooting and videography). 2) Despite upgrade to the Bionz X processor used in all their new cameras, video still appears to use line skipping of previous generation cameras. This essentially means that the Sony RX 100 III (which samples the full frame to generate a 1080p image instead of the older line skipping approach) will have slightly better video than the Sony A77II. Baffling omission. Question if this is fixable in firmware update? 3) EVF can still struggle under exceptionally bright conditions, although now with a greater range of brightness adjustment, this usually can now be accommodated. Purists and those wedded to OVF use will simply not enjoy or tolerate this camera for this reason alone. (But in low light, this EVF is actually easier to see your subject through than OVF due to the gain provided!) 4) Loss of GPS and IR focus assist in low light (the latter presumably not needed as much). Balanced by WiFi and NFC? A good tradeoff for most but a bummer for those who loved the GPS feature. 5) Another tradeoff around the adoption of the ISO standard hot shoe - good for everybody new to the brand, except those of us with the old Minolta type flash mounts? Fixable with neat little Sony adapter. 6) Some strange 'yellow pixelation' artifacts in low light shooting at very high ISO in RAW images only? UPDATE - THESE DISAPPEARED AFTER REBOOTING SONY'S RAW IMAGE CONVERTER - SUGGESTING SOFTWARE ARTIFACT/BUGGY RAW FILE CONVERTER SOFTWARE FROM SONY (SEE COMMENTS). Why can't Sony make decent RAW software tools - and no in camera RAW editing either? Come on Sony 7) No 4K video. My #1 real gripe and a potentially glaring omission (see Canon FF and Panasonic GH4). ? fixable in future firmware. 8) Still no low light phenom and at least 1 f-stop or more from many FF cameras. 9) Sony customer service can be trick or treat. They have a long way to go to match Apple, Amazon, and other elite tech companies in customer service, but they are getting better based on a recent survey. Conclusions: Sony, despite mixed reviews on this point in relationship to some past products, appears to have been actually listening in relationship to the SLT line. Sometimes other dubious design decisions appeared impervious to user feedback, but in relationship to the Alpha 77, they actually listened to user complaints and addressed every single issue, improving its low light noise, its autofocus, and its buffer depth, while keeping and even enhancing the previous generation camera's considerable feature set and strengths. Not only is this the best semipro camera right now out there, I think it competes pretty favorably with the big full frame boys. It gives up only a little bit of resolution to the Nikon 800/810 and Sony A7r, and concedes a little bit of lowlight ability to all the full frame cameras, but only ~ one stop now instead of ~ 2 stops. With some non-stabilized lenses on full frame, the A77ii with full time IS is going to exceed those FF low light abilities by ~ a full stop, give or take (not counting low light phenoms like A7S and D4S). This great IS system really mitigates the camera's main physical performance limitation relative to FF (with IS, it beats my RX1 in low light by more than a stop). My one major disappointment is the apparent failure to upgrade the video sampling approach (to the full frame sampling seen in the RX100iii and RX10) and the obvious absence of a 4K video option (as I think 4K is going to explode over the next two years, as 4K sets enter the mainstream). I have not had enough time to really compare this camera's video output with the previous generation A77 or with the RX100III, Canon 5DII, GH2/3/4 and other strong video cameras (update on this one coming). It still could be more competent video functioning than its SLT predecessors. If the tradeoffs of APS-C make sense to you, I have to believe that you will love the A77ii, if you're in the market for a state-of-the-art photographic imaging system. Highly recommended overall.
